

Abstract

A device for releasing substances into the mouth, that comprises an intra-oral pacifier provided with a sucking element that partially or fully occupies the mouth of a user. The sucking element is used for releasing flavor substances and is made from materials in the natural or unnatural latex family. An adequate amount of the substances is provided inside, or on the pacifier. The substances may include some nicotine for smoking cessation, antibacterial materials for curing intra-oral diseases, or flavor or odor substances.
